**Purpose of Study:**
To evaluate the safety and effectiveness of giving an increased dose of the 2010-2011 seasonal flu vaccine to infants and young children.

**Background:**
Influenza, commonly called "the flu," is a germ that causes respiratory illness. Infants and young children have the highest rates of infection and complications due to the flu, but receive half the dose given to children 3 years and older.

**Procedures:**
- Infants /Children must be 6 - 35 months of age and in good health
- Every child will receive the flu vaccine (there is no placebo)
- The vaccine formulation is free of thimerosal
- Parents must know their child’s flu vaccine history:
  - No prior flu vaccine or
  - 2 doses of 2009-2010 H1N1 AND 2 doses of flu vaccine anytime in the past
- The “vaccine history” will determine the number of visits. There will be 2-3 clinic visits and 3-4 phone calls.
- A small amount of blood will be drawn at each visit.
- Parents will be given a vaccination diary to record temperatures and any reactions or illnesses for 10 days after each vaccination.

Duration of the study is approximately 6 months from the time of enrollment.

- There is no charge for the study vaccines, laboratory tests, or study visits.
- Parents will receive compensation for time, travel and parking expenses.
