A March 2022 award of 100 million dollars to Emory University's School of Medicine.

The Emory University School of Medicine has received a $100 million award from the National Institutes of Health (NIH) to support research and training in the area of infectious diseases. The grant, which is one of the largest ever awarded to a single institution, will support a range of initiatives aimed at addressing some of the most pressing challenges in the field.

The funding will be used to support a variety of research projects focused on topics such as antibiotic resistance, HIV/AIDS, and emerging infectious diseases. It will also provide support for training programs aimed at preparing the next generation of researchers and practitioners.

The project is led by Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases (NIAID), and will involve collaboration with other institutions and organizations.

The grant is part of a broader effort by the NIH to support research and training in the area of infectious diseases. The NIH has invested billions of dollars in this area over the past decade, and the award to Emory is a testament to the importance of this work.

The Emory University School of Medicine is one of the leading institutions in the world for research and training in infectious diseases. The school is home to the Emory Vaccine Center, the World Health Organization Collaborating Center for Hepatitis A, and the National Institute of Health Clinical Research Unit, among other research programs.

The award is expected to have a significant impact on the field of infectious diseases, and will provide a major boost to the research and training efforts at Emory and beyond.
